

There is an occlusion of the distal aspect of the midportion of the right coronary artery, with no contrast seen within the distal aspect of the vessel. Calcium is seen within the very distal aspect of the vessel just before the take-off of the posterior descending coronary artery.

(Minimal 0%-25%, Mild 25%-50%, Moderate 50%-70%, Severe >70%)

Cardiac findings:

<i>Cardiac Chambers:</i>	Normal.
<i>Cardiac Valves:</i>	Normal.
<i>Pericardium:</i>	Normal.
<i>Aorta:</i>	Normal.
<i>Pulmonary Arteries:</i>	Normal.

Other findings:

<i>Lung parenchyma:</i>	There is mild to moderate circumferential bronchial wall thickening involving both lung bases. There are multiple areas of atelectasis. There is a large area of emphysema involving the right middle lobe
<i>Chest wall:</i>	The visualised chest wall appears normal.
<i>Mediastinum:</i>	Multiple calcified mediastinal and upper abdominal lymph nodes are identified.
<i>Upper abdomen:</i>	The visualised upper abdomen appears normal.
<i>Osseous structures:</i>	The visualised osseous structures appear normal.

Conclusion:

Occlusion of the distal right coronary artery.

Mild diffuse mixed plaque seen elsewhere.
